Which IOTA method to use?
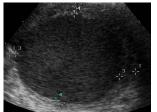

1/Simple Rules
- Inconclusive = malignant
- Inconclusive = refer to expert
- Inconclusive = LR1, LR2, ADNEX or SRRc
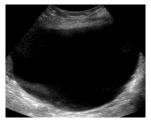

All are safe!

2/ADNEX (LR1, LR2, or SRRc) for all

3/ "Modified benign easy descriptors" (unilocular endometriomas, unilocular dermoid cysts, all other unilocular cysts with smooth walls < 10 cm = benign)

ADNEX for the others
Adnex for magnitude of malignancy risk
Adnex for type of malignancy

How do I interpret the risk of malignancy calculated by ADNEX?
